Question 1 (100 points)

Let's switch over to coding! Write some code in this cell to compute the number of unique word **tokens** in this paragraph (5 steps of Text Normalisation: 1. Lowercase Conversion, 2. Remove punctuations, 3. Stemming, 4. Lemmatisation, 5. Stopword Removal). Use a whitespace tokenizer to separate words (i.e., split the string by white space). Be sure that the cell's output is visible in the PDF file you turn in on Github.

from nltk.stem.snowball import SnowballStemmer
paragraph = '''Last night I dreamed I went to Manderley again. It seemed to me
that I was passing through the iron gates that led to the driveway.
The drive was just a narrow track now, its stony surface covered
with grass and weeds. Sometimes, when I thought I had lost it, it
would appear again, beneath a fallen tree or beyond a muddy pool
formed by the winter rains. The trees had thrown out new
low branches which stretched across my way. I came to the house
suddenly, and stood there with my heart beating fast and tears
filling my eyes."
# DO NOT MODIFY THE VARIABLES
